Creating Groups of Commands

Creating Groups of Commands

! Important

This documentation describes the use of the legacy command-based library. While this documentation has been preserved to help teams that have yet to do so, teams are strongly encouraged to migrate to the [new command-based library](#).

! Note

Once you have created commands to operate the mechanisms in your robot, they can be grouped together to get more complex operations. These groupings of commands are called CommandGroups and are easily defined as shown in this article.

Complex Operations

Java

C++

en

2021

```

#include "PlaceSoda.h"
#include "Elevator.h"
#include "Wrist.h"

PlaceSoda::PlaceSoda()
{
    AddSequential(new SetElevatorSetpoint(Elevator::TABLE_HEIGHT));
    AddSequential(new SetWristSetpoint(Wrist::PICKUP));
    AddSequential(new OpenClaw());
}

```

This is an example of a command group that places a soda can on a table. To accomplish this, (1) the robot elevator must move to the `TABLE_HEIGHT`, then (2) set the wrist angle, then (3) open the claw. All of these tasks must run sequentially to make sure that the soda can isn't dropped. The `addSequential()` method takes a command (or a command group) as a parameter and will execute them one after another when this command is scheduled.

Running Commands in Parallel

Java

C++

```

#include "PrepareToGrab.h"
#include "Wrist.h"
#include "Elevator.h"

PrepareToGrab::PrepareToGrab()
{
    AddParallel(new SetWristSetpoint(Wrist::PICKUP));
    AddParallel(new SetElevatorSetpoint(Elevator::BOTTOM));
    AddParallel(new OpenClaw());
}

```

To make the program more efficient, often it is desirable to run multiple commands at the same time. In this example, the robot is getting ready to grab a soda can. Since the robot isn't holding anything, all the joints can move at the same time without worrying about dropping anything. Here all the commands are run in parallel so all the motors are running at the same time and each completes whenever the `isFinished()` method is called. The commands may complete out of order. The steps are: (1) move the wrist to the pickup setpoint, then (2) move the elevator to the floor pickup position, and (3) open the claw

Mixing Parallel and Sequential Commands

Java

C++

```
#include "Grab.h"
#include "Elevator.h"
#include "Wrist.h"

Grab::Grab()
{
    AddSequential(new CloseClaw());
    AddParallel(new SetElevatorSetpoint(Elevator::STOW));
    AddSequential(new SetWristSetpoint(Wrist::STOW));
}
```

Often there are some parts of a command group that must complete before other parts run. In this example, a soda can is grabbed, then the elevator and wrist can move to their stowed positions. In this case, the wrist and elevator have to wait until the can is grabbed, then they can operate independently. The first command (1) `CloseClaw` grabs the soda and nothing else runs until it is finished since it is sequential, then the (2) elevator and (3) wrist move at the same time
